

Food Delivery Performance Dashboard

Problem Statement

The food delivery industry generates a large amount of operational data every day, including customer orders, delivery time, delivery partner ratings, vehicle usage, traffic conditions, and festival information. Analyzing this data manually is difficult and time-consuming.

The objective of this project is to build an interactive Tableau dashboard that helps analyze delivery performance and identify business trends. The dashboard provides visual insights into key performance indicators (KPIs) such as total orders, average delivery rating, and average delivery time. It also analyzes order distribution across different city types, vehicle types, traffic conditions, festival periods, and delivery categories.

The dashboard enables users to interactively filter data and supports better business decision-making by presenting information in a simple and visually meaningful format.

Objectives

- Analyze food delivery performance using Tableau.
 - Create an interactive dashboard with filters.
 - Monitor important KPIs.
 - Identify delivery trends based on city, vehicle type, traffic density, and festivals.
 - Generate business insights that can help improve operational efficiency.
-

Tools Used

- Tableau Desktop 2026.1
 - CSV Dataset
-

Key Performance Indicators (KPIs)

- Total Orders
 - Average Delivery Rating
 - Average Delivery Time
-

Visualizations Created

- Orders by City
- Orders by Vehicle
- Traffic Density Analysis
- Festival Analysis

- Delivery Category Analysis
-

Expected Outcome

The dashboard provides an easy-to-understand visualization of food delivery operations. It allows users to monitor performance, identify trends, and make informed business decisions through interactive filters and charts.
